

NAME:

osv-scanner - scans various mediums for dependencies and checks them against the OSV database

USAGE:

osv-scanner [global options] command [command options]

EXAMPLES:

Scan a source directory

\$ osv-scanner scan source -r <source_directory>

Scan a source directory in offline mode

\$ osv-scanner scan source --offline-vulnerabilities --download-offline-database -r <source_directory>

Scan a container image

\$ osv-scanner scan image <image_name>

Scan a local image archive (e.g. a tar file) and generate HTML output

\$ osv-scanner scan image --serve --archive <image_name.tar>

Fix vulnerabilities in a manifest file and lockfile (non-interactive mode)

\$ osv-scanner fix -M <manifest_file> -L <lockfile>

For full usage details, please refer to the help command of each subcommand (e.g. osv-scanner scan --help).

Alternatively, you can access the detailed documentation here: <https://google.github.io/osv-scanner/>

VERSION:

2.3.3

COMMANDS:

scan	scans projects and container images for dependencies, and checks them against the OSV database.
fix	scans a manifest and/or lockfile for vulnerabilities and suggests changes for remediating them
experimental-mcp	Run osv-scanner as an MCP service (experimental)

GLOBAL OPTIONS:

--help, -h show help --version, -v print the version
